12. Name and mailing address of applicant representative(s), if any, to serve in this application and receive all papers:

Dr. J. A. Asleson
Dean of Agriculture & Director
Agricultural Experiment Station
Montana State University
Bozeman, Montana 59715

13. CHECK BOX BELOW FOR EACH ATTACHMENT SUBMITTED:

- ☒ 12A. Exhibit A, Origin and Breeding History of the Variety (See Section 52, P.L. 91-577)
- ☒ 12B. Exhibit B, Botanical Description of the Variety
- ☐ 12C. Exhibit C, Objective Description of the Variety
- ☒ 12D. Exhibit D, Data Indicative of Novelty
- ☒ 12E. Exhibit E, Statement of the Basis of Applicant's Ownership

The applicant declares that a viable sample of basic seed of this variety will be deposited upon request before issuance of a certificate and will be replenished periodically in accordance with such regulations as may be applicable. (See Section 52, P.L. 91-577).

14A. Does the applicant(s) specify that seed of this variety be sold by variety name only as a class of certified seed? (See Section 83(a), P.L. 91-577) (If "Yes," answer 14B and 14C below.) <input checked="" type="checkbox"/> YES <input type="checkbox"/> NO	
14B. Does the applicant(s) specify that this variety be limited as to number of generations? <input checked="" type="checkbox"/> YES <input type="checkbox"/> NO	14C. If "Yes," to 14B, how many generations of production beyond breeder seed? 2

Applicant is informed that false representation herein can jeopardize protection and result in penalties.

The undersigned applicant(s) of this sexually-reproduced novel plant variety believes that the variety is distinct, uniform, and stable as required in Section 41 and is entitled to protection under the provisions of Section 42 of the Plant Variety Protection Act (P.L. 91-577).

INSTRUCTIONS

GENERAL: Send an original copy of the application, exhibits and \$50.00 fee to U.S. Dept. of Agriculture, Consumer and Marketing Service, Grain Division, Hyattsville, Maryland 20782. Retain one copy for your files. All items on the face of the form are self-explanatory unless noted below.

ITEM

- 5 Insert the date the applicant determined that he had a new variety.
- 12a First, give the genealogy, including public and commercial varieties, lines, or clones used, and the breeding method. Second, give the details of subsequent stages of selection and multiplication. Third, indicate the type and frequency of variants during reproduction and multiplication and state how these variants may be identified. Fourth, provide evidence on stability.
- 12b First, give any special characteristics of the seed and of the plant as it passes through the seedling stage, flowering stage and the fruiting stage. Second, describe the mature plant and compare it with a similar commercial variety grown under the same conditions, and indicate the differences.
- 12c A supplemental form will be furnished by the PVPO to describe in detail a variety for each kind of seed.
- 12d Provide complete data indicative of novelty. Seed and plant specimens may be submitted and seeds submitted may be sterile. Where possible, include photographs of plant comparisons, chemical tests, etc.
- 12e Indicate whether applicant is the actual breeder, the employer of the breeder, the owner through purchase or inheritance, etc.

12A Origin and Breeding History of the Variety

A total of 180 different plant introductions of the genus Onobrychis obtained from the Plant Introduction Station at Pullman, Washington were seeded at Bozeman, Montana in 1963. These introductions were evaluated for regrowth after hay harvests in 1965 and 1966. Sixteen introductions of the species viciaefolia Scop. were selected in 1966 for their regrowth ability. The plant introduction numbers are: 212,241; 223,389; 227,038; 227,373; 228,289; 228,352; 228,402; 229,612; 236,486; 239,957; 239,958; 239,959; 239,960; 243,226; 243,227; 250,024.

Ten randomly selected plants from each P.I. were space planted in an isolated crossing block in 1967. Seed was harvested from the entire block in 1967. The breeding method was mass selection for the regrowth characteristics.

The seed harvested from this population of selected introductions is the breeders seed of the variety. Two subsequent generations have been produced from this breeders seed. No apparent variants have been observed during these generations of multiplication. Comparative plantings of the three generations have not differed for observable variants and all generations have exhibited the regrowth characteristics. This is evidence of the stability for the regrowth character in this variety.

12B Botanical Description of the Variety

Seedlings of Remont are more erect in growth habit and begin elongation for flowering three to four weeks after seeding while the single cut sainfoin variety Eski has a rosette growth habit the year of seeding. Approximately 90-95% of the plants in Remont will flower in the year of seeding while about 10-20% of the plants of Eski will flower in the year of seeding. Remont will produce a seed crop the year of seeding while Eski will not produce enough seed to warrant harvesting the seedling year.

Remont will begin growth earlier in the spring and reach flowering about a week earlier than Eski. Mature plants of Remont will recover more rapidly after hay or pasture harvest than Eski. Remont plants will flower profusely two or three times during the growing season with or without foliage removal while Eski plants generally flower profusely only once and will not initiate new growth until the old plant material is removed. Remont plants as a group tend to be lighter green than Eski.

12D Data Indicative of Novelty

90% of Remont plants will flower the year of seeding when seeded between April 15 and June 1 where the day lengths are 11 to 13 hours long. Less than 20% of the plants of Eski will flower under similar conditions. Remont plants begin to elongate earlier in the spring than Eski. (Photo 1). Remont plants will regrow more than Eski after harvest (Photo 2). Remont plants will initiate new growth through mature stems and flower repeatedly without foliage removal while Eski plants will not do either (Photos 3 and 4).

DEPARTMENT OF PLANT & SOIL SCIENCE

COLLEGE OF AGRICULTURE

MONTANA STATE UNIVERSITY, BOZEMAN 59717

January 3, 1979

Mr. Joseph J. Higgins, Examiner
Plant Variety Protection Office
USDA, Agricultural Marketing Service
National Agricultural Library Building
Beltsville, MD 20705

Dear Mr. Higgins:

Sainfoin Application 7200105 'Remont'

Enclosed is the Objective Description of Remont.

Remont most closely resembles Eski; but Remont attains 50% bloom the year of seeding, and in the second year, matures earlier than Eski in the spring and has more rapid regrowth following harvest. In addition, in the second year Remont has narrower crowns, shorter terminal leaflets, fewer seed/raceme, slightly lower seed and pod weight, and lower seed production than Eski.

Sincerely yours,

Raymond L. Ditterline
Associate Professor of Agronomy

RLD/lmc

enc.

^{2/} Days from Aug. 1 to 50% bloom.

Statement of Novelty

'Remont' was selected for increased forage yield the year of seeding, and more rapid regrowth after being harvested for hay or pasture in subsequent years (3). At Bozeman, Montana, Remont seedlings are more erect in growth habit and begin to elongate for flowering 3-4 weeks after seeding, whereas 'Eski' (one cut type) seedlings tend to rosette. The year of seeding 90% of Remont plants flower, whereas less than 20% of Eski plants flower. These differences in seedling year growth habit are reflected in a large increase in yield of Remont over Eski (5) (Table 1).

^{2/} Seeded 1967

^{3/} Northrup King selections

In subsequent years Remont yields more than Eski when cut three times to simulate pasture conditions (5); the same as Eski when cut twice for hay (4) or once for hay and twice for pasture (5); and less than Eski when cut once for hay and all regrowth is allowed to "stockpile" until mid-September (5) (Tables 1,3). The seasonal yield distributions of these two cultivars also vary according to the management treatment imposed (4,5) (Table 2,3). When cut three times to simulate pasture usage (Table 2), Eski and Remont yield similarly on the first two cuts, and Remont's superior regrowth potential is not observed until the third cut when it yields much more than Eski (5). When cut twice for hay (Table 3), or once for hay and twice for pasture, (Table 2), Remont yields less than Eski on first cut and more than Eski on subsequent cuts (4, 5). Season total yields are similar. When cut once for hay and all hay is allowed to "stockpile" until mid-September (Table 2), Remont yields less than Eski on first cut and the same as Eski on second cut (5). Cooper (5) stated, "Under this system, Remont, with its rapid regrowth, flowered in mid-August and had developed mature seed by late September. In contrast, Eski, with its slow recovery, was in bloom late in September. Remont plants turned brown and lost leaves, but Eski plants did not."

^{1/} Average of each cultivar grown alone and in mixtures with each of two grasses and four legumes. Harvest or total season yield values of the two cultivars in each year not followed by letters in common are significantly different at the 5% level of probability (5).

^{2/} Year of seeding.

^{3/} After Cooper (4).

Remont's superior regrowth ability is also reflected in seed production. Montana Remont seed producers harvest two seed crops annually, whereas Eski seed producers harvest only one. In addition, at maturity Remont plants will initiate new growth through old growth without foliage removal. Eski plants will not.

'Melrose', the only cultivar licensed to be sold in Canada, is a one cut type cultivar very similar to Eski in growth habit, yield and seasonal yield distribution (1, 2). It does not possess the rapid regrowth characteristic of Remont (Table 4). The rapid regrowth character of Remont usually results in one cutting of hay more than Eski and Melrose.

Table 4. Total yield (T/A) and seasonal yield distribution (T/A) of Eski, Remont and Melrose sainfoin harvested at Creston, Montana, in 1974 and 1975. 1/

Cultivar	Harvest late 1974 <u>2/</u>				Total
	6/25	7/22	8/22	9/19

OBJECTIVE DESCRIPTION OF VARIETY
Sainfoin (*Onobrychis viciifolia* Scop.)

Characteristics described, including numerical measurements, should represent those that are typical for the variety. Ranges may be given also. Measured data should be for SPACED PLANTS. Describe location and environmental conditions of test area(s) in Section 11. All questions need not be answered; however, strive for completeness in order to establish the most accurate variety identification.

 2 g/1000 pods less than **1** } 1=Eski
 Same as } 2=Melrose
 4 g/1000 pods more than **2** } 3=Remont

SEE TABLE 1.

9. SEED WEIGHT:

1 **4** g/1000 seeds
 2 g/1000 seeds less than **1** } 1=Eski
 Same as } 2=Melrose
 3 g/1000 seeds more than **2** } 3=Remont

SEE TABLE 1.

10. SEED PRODUCTION:

6 g/plant (seedling year)
 g/plt less than } *
 same as } Comparison
 5 g/plt more than **1** } Variety

3 **1** g/plant (2nd year)
 1 **7** g/plt less than **1** }
 same as } Comparison
 2 **8** g/plt ~~more~~ less than **2** } Variety

SEE TABLE 1.

* Deer got into the Melrose nursery the year of seeding thus we were unable to get significant seed set.

11. CHEMICAL COMPOSITION (Dry Matter Basis, 2nd year, 50% bloom):

Comparison variety ☐

Variety	Protein %	Ether Extract %	Nitrogen Free Extract %	Crude Fiber %	Ash %	Calcium %	Phosphorous %
Applicant	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Comparison Variety	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	Acid Detergent Fiber %	Neutral Detergent Fiber %					
Applicant	<input type="checkbox"/>	<input type="checkbox"/>					
Comparison Variety	<input type="checkbox"/>	<input type="checkbox"/>					

12. DISEASES AND INSECTS (1 = not tested, 2 = susceptible, 3 = resistant):

<input type="checkbox"/> 2	<u>Fusarium solani</u>	<input type="checkbox"/> 1 *	<u>Sitona scissifrons</u>
<input type="checkbox"/> 2	<u>Fusarium oxysporum</u>	<input type="checkbox"/> 1 *	<u>Lygus spp.</u>
<input type="checkbox"/> 1 *	<u>Ascochyta onobrychidis</u>	<input type="checkbox"/> 1 *	<u>Bruchidius unicolor</u>
<input type="checkbox"/> 1	<u>Sclerotinia trifoliorum</u>	<input type="checkbox"/> 2	Other <u>Pseudomonas syringae</u>
<input type="checkbox"/> 1	<u>Rhizoctonia solani</u>	<input type="checkbox"/> 2	Other <u>Pseudomonas marginalis</u>
		<input type="checkbox"/> 2	Other <u>Erwinia amylovora</u>

* Not tested, but visual observation strongly suggests that all three varieties are susceptible.

Note: Under 13 ADDITIONAL DESCRIPTION, give comparative reaction with standard variety and indicate if the variety exceeds, equals, or is less than the standard.

SEE TABLES 3, 4, and 5

13 ADDITIONAL DESCRIPTION: (Use additional sheets as required)

- Describe location and environmental conditions of test area(s).
- Describe all characteristics that cannot be adequately described in the form above. Comparative varieties should be used as may be appropriate, such as for disease. Append all comparative trial and evaluation data, including measured characters, and disease tests.

12E Statement of the Basis of Applicant's Ownership

The applicant is the employer of the breeder who developed Remont Sainfoin.
